ABSTRACT

The U.S. Army Corps of Engineers (Corps) administers the National Wetland Plant List (NWPL) for the United States (U.S.) and its territories. Responsibility for the NWPL was transferred to the Corps from the U.S. Fish and Wildlife Service (FWS) in 2006. The list was updated in 2012, and the Corps led an interagency effort to revise the list again in 2013. As part of the authorization of the revised NWPL in 2012, new methods were adopted for annual updates to the scientific names, regional distribution, and wetland ratings. This paper presents the third update of the list under Corps administration. The 2012 list contained 7,828 species, and the 2013 update contained 7,937 species. As part of the BONAP (Biota North America Program) database used for the 2013 update, there were 754 reports of species of wetland plants with new range extensions within the 10 Corps wetland regions. Also, BONAP and other users requested that 124 other species be added to the NWPL, which increases the number of species to 8061. These 878 species were evaluated and rated by Regional Panels and by the National Panel representatives from four agencies. The inclusion of these species represent the 2014 update to the NWPL.

BACKGROUND

Since the Corps assumed administrative responsibilities for the NWPL in 2006, the list has gone through an extensive updating process that culminated in its authorization for national use in May 2012 (Federal Register 2012; Lichvar 2012). The development of the 2012 list was a cooperative effort between four federal government agencies: the Corps, the FWS, the U.S. Environmental Protection Agency (EPA), and the Natural Resources Conservation Service (NRCS). The effort was managed by a National Panel consisting of representatives from the four agencies. The 2012 NWPL is the standard reference for wetland indicator status ratings of vascular plants in the United States and territories, and is used for many purposes, including wetland delineation, assessment, mitigation, and habitat restoration. The NWPL is available to all users through a web application (http://wetland_plants.usace.army.mil/).

The 2012 update built on the legacy of the FWS's 1988 (Reed 1988), 1993 Region 9 (Northwest) Supplement (Reed, 1993), and draft 1996 wetland plant lists. It updated all taxonomic views and nomenclature in accordance with BONAP and revised wetland ratings (Lichvar and Minkin 2008). Additionally, the 2012 revision included several changes to the management of the NWPL, along with revised definitions of wetland categories, new Corps geographic wetland regions, protocols for challenging wetland ratings, and procedures for annual revisions.

As with previous versions of the wetland plant list, the 2012 NWPL and updates support wetland delineation efforts under Sec. 404 of the Clean Water Act and the Swampbuster provisions of the Farm Bill (as amended), and it is used in the National Wetland Inventory Program. To accomplish this more effectively, the Corps re-aligned the NWPL's geographic regions to correspond to those of federal wetland efforts, including the interagency wetland delineation manual and its regional wetland delineation supplements. The NWPL is now divided using the 10 regional Corps wetland delineation regions for the U.S. and its territories (Wakeley 2002) (Fig. 1). Included within four of these Corps regions are 17 subregions in which small numbers of wetland plants have wetland ratings that differ from the ratings for the same plants in the rest of the region.

Figure 1. Geographic regions for the 2012 NWPL, based on Corps regions.

The five wetland rating categories in the NWPL were developed in the 1980s by Reed (1988). Each plant species was assigned a rating representing the estimated probability, or frequency, with which it was thought to occur in wetlands, as opposed to non-wetlands, across its entire range. The 1988 ratings were divided into categories based on quantitative ranges of frequency, but the 2012 ratings were based on simpler qualitative definitions (Lichvar et al. 2012) (Table 1). Indicator status ratings are now assigned to each species based on a review of the botanical literature and herbarium records, along with the best professional judgment of national and regional experts. Longer quantitative rating definitions are still used, but only for field testing of wetland ratings.

Table 1. Short qualitative descriptions of the five wetland indicator status ratings used to determine if vegetation is hydrophytic during wetland delineations in the United States.

Indicator status	Designation	Qualitative Description
Obligate (OBL)	Hydrophyte	Almost always occur in wetlands
Facultative Wetland	Hydrophyte	Usually occur in wetlands, but may occur in non-
Facultative (FAC)	Hydrophyte	Occur in wetlands and non-wetlands
Facultative Upland	Nonhydrophyte	Usually occur in non-wetlands, but may occur in
Upland (UPL)	Nonhydrophyte	Almost never occur in wetlands

ANNUAL UPDATE PROCESS

As part of the 2012 NWPL update, representatives from each of the four Federal agencies responsible for the NWPL agreed on new protocols and procedures for managing the list. These procedures were described in the 2012 Federal Register announcement for updating the NWPL. Under the NWPL authorization, it is now possible to update and maintain the list annually so that the nomenclature and taxonomy do not become outdated and wetland ratings can be refined as new information becomes available. In particular, the annual NWPL updates will include additions or deletions to the list; modifications to wetland indicator statuses that were revised during the previous year; and updates of the nomenclature, taxonomy, and geographic distribution of species on the NWPL.

The annual update of the list has two steps. First, this and previous updates to the database for nomenclature, taxonomy, and U.S. state/Canadian province and U.S. county-level phytogeography have been made by Dr. John Kartesz of BONAP. Second, input from the public, as well as from federal and state agencies, is used to modify wetland ratings by processes of evaluation that are similar to those used during the 2012 update. These requests may include adding new species to the list.

The annual update is released in three parts: 1) the NWPL web site is updated to reflect any modifications from the previous year, 2) a series of downloadable files for the Corps regions and states is made available via the web site, providing local lists of wetland species and their wetland indicator ratings, and 3) the national list is published and subdivided by Corps regions. This publication represents the third component of the 2014 update.

THE 2014 NWPL UPDATE

The 2012 NWPL contained 7,828, and the 2013 NWPL contained 7,937 wetland plants for the United States and its territories. The 2014 NWPL has increased to 8,061 wetland plants, mainly because of newly suggested additions to the list and geographic range extension reports for species new to a Corps wetland region. The 2014 NWPL update is in the Appendix A.

The 2014 NWPL update list is based on the database we received from BONAP in 2013 and used in generating the 2013 NWPL update. Included in the 2013 BONAP database were 754 species with new geographic range extensions in Corps wetland regions and 123 species proposed for consideration to be added to the NWPL. We postponed evaluating these species until 2014. In addition, the National Panel (NP) requested that *Lonicera japonica* Thunb. occurring in the Atlantic and Gulf Coastal Plain be reevaluated by that Regional Panel (RP).

For the 2014 NWPL update, we evaluated and rated 878 species. The first step in the updating process was to see if any of these species occurred in other Corps regions. If they did and if they were rated in two or more regions with the same wetland rating, we assigned the same wetland rating to the species in the new geographic region. This group then was referred to as the “auto assigned” group. If a species had only one other rating or the ratings varied across the Corps regions, we moved it to the next step. There were 294 species in the auto assigned group. The remaining species were evaluated by a Regional Panel (RP) consisting of one representative from each of the four agencies within the Corps regions where the species occurs. The RP reviewed the literature, interviewed other professional botanists, and used their personal field observations to assign wetland ratings. The RPs, by consensus, assigned ratings to 450 species. Those species for which the RP did not reach consensus were then evaluated and rated by the NP. The NP assigned wetland ratings for 246 species. The culmination of these steps and assigned rating then represent the 2014 efforts to update the NWPL.

ACKNOWLEDGEMENTS

Many people, agencies and organizations are involved in maintaining and improving the accuracy of the NWPL, and they are all thanked for their support and input. The bulk of the effort and thanks goes to the National and Regional Panel members across the country who dedicate significant time and energy responding to requests to evaluate endless lists of wetland plants. Many people in the public sector have made valuable suggestions and input about wetland species. Underlying these efforts is the work of several key people, who are thanked: John Kartesz at BONAP, who keeps the database updated, and Misako Nishino, who maintains the BONAP database; Rick Bates, who manage to keep millions of data points in the right places; and Jennifer Gillrich and Lindsey Lefebvre, who make it all happen. We thank the Wetland Regulatory Assistance Program of the U.S. Army Corps of Engineers for funding these efforts.
